

Synthetic responses are too concentrated and too coherent

A. Repeated draws still compress variance

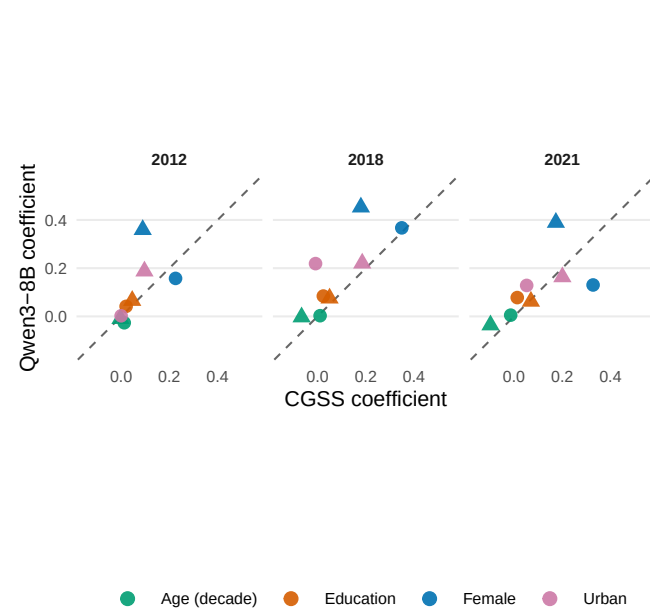

B. Independent items weakly reduce coherence

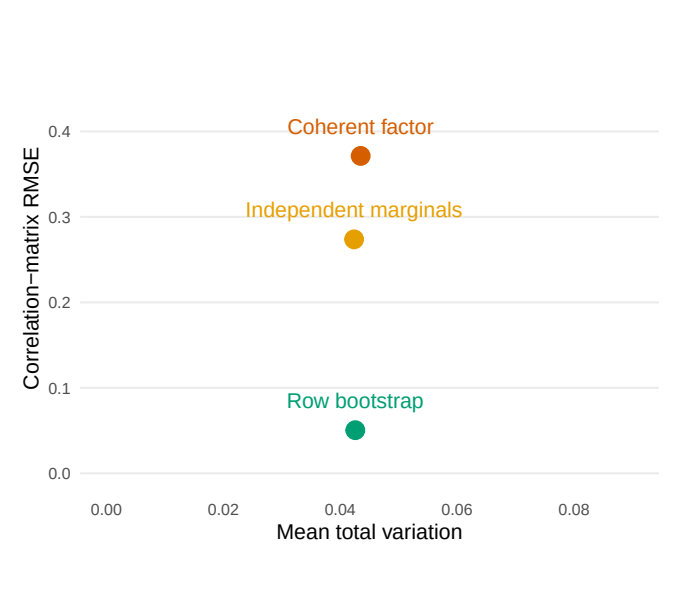

C. Demographic gradients are only partially recovered

Coefficient RMSE = 0.116 across 24 comparisons

D. Monte Carlo: marginal fit can hide structural failure

1,000 replications; n = 300; all scenarios use CGSS marginals

Notes: Dashed lines mark exact recovery. Subgroup regressions adjust simultaneously for sex, education, age, and urban residence. Circles denote equal housework and triangles the public-item index. Monte Carlo standard errors are smaller than the plotted symbols.
